FALCON BMS 4.33 ISRAEL THEATER

A. GENERAL INFORMATIONS & ABBREVIATIONS

Distances in nautical miles.

Runway dimensions in feet.

Altitudes/Elevations in feet Mean Sea Level (MSL).

Radials/Headings are magnetic.

Vertical Descent Angle (VDA) is calculated from FAF to threshold.

ALT	Altitude
Chan	Channel
DME	Distance Measuring Equipment
FAF	Final Approach Fix
FT	Feet
IAF	Initial Approach Fix
IAS	Indicated Airspeed
Ldg	Landing
LOC	Localizer
LR-	Lead Radial (followed by 3 digits)
MDA	Minimum Descent Altitude
MSA	Minimum Safe/Sector Altitude
NM	Nautical Miles
R-	Radial (followed by 3 digits)
RWY	Runway
S-	Straight-in approach
TACAN	Tactical Air Navigation equipment
TDZE	Touchdown Zone Elevation
VORTAC	VOR and TACAN navigational facilities collocated
WPT	Waypoint

RATE OF CLIMB/DESCENT TABLE

CLIMB/DESCENT ANGLE (DEGREES)	CLIMB/DESCENT GRADIENT (FT/NM)
2.5°	265 ≈ 250
3.0°	318 ≈ 300
5.0°	530 ≈ 500
10.0°	1,060 ≈ 1,000

B. USEFUL INFORMATIONS ABOUT THE EXECUTION OF THE PROCEDURES

1) Maximum precise in DME (distance in Nautical Miles)

In order to have the maximum precise in indication of DME (distance from the NavAid in NM), do the follow: insert the GPS coordinates of the NavAid (TACAN or VORTAC station) over a steerpoint (STPT) and make this steerpoint as current. GPS coordinates of the NavAid given by the IAP chart. Then set the proper NavAid channel, the band to X (airports - ground) and the Instr Mode switch to TCN. In this way you will have indications for bearing and distance at the HSI from NavAid as in real life, but also indication for distance with one decimal digit in the lower right corner in the HUD. This is critical for the precise of the final turn due to the fact that very often the DME of the last steerpoint (that we turn to final approach course aligned with runway centerline) has a decimal digit and the indication for distance at the HSI reads only integer numbers.

2) Turns

If not published in the IAP charts, turns to join and to leave an arc, turns of missed approach and holding turns must be executed with IAS 250 KTS and bank angle of 30 degrees. Also if not published in the Departure charts, turns must be executed with IAS 300 KTS and bank angle of 30 degrees.

3) Final turn and impact of wind

Even if you turn at final steerpoint at exactly DME, you may find yourself aligned with runway centerline but offset. This happens due to active wind and not of the inaccuracy of the IAP chart. So in this situation:

A) The NavAid is **LEFT** of the runway, example of Bocas Del Toro Intl with final turn at R-151/2.1 DME.

i] if you fly offset of runway and left of it (red course in photo) execute a missed approach and at the next approach turn 0.1 DME sooner, means at R-151/2.2 DME.

ii] if you fly offset of runway and right of it (green course in photo) execute a missed approach and at the next approach turn 0.1 DME later, means at R-151/2.0 DME.

B) The NavAid is **RIGHT** of the runway, example of Nea Anchialos with final turn at R-090/2.5 DME.

i] if you fly offset of runway and left of it (red course in photo) execute a missed approach and at the next approach turn 0.1 DME later, means at R-090/2.4 DME.

ii] if you fly offset of runway and right of it (green course in photo) execute a missed approach and at the next approach turn 0.1 DME sooner, means at R-090/2.6 DME.

All the previous can be applied when at the final steerpoint the AOA is 11-13 degrees and the CDI at HSI centered almost perfect or at least with 0.5 degree maximum variation.

4) Calculating the descent

In order to execute the descents with precise, you must convert the rate of descent that shown in the IAP charts in FT/NM to degrees. This can be done via the table "RATE OF CLIMB/DESCENT TABLE" in page 3 as follow: multiply the FT/NM of the rate of descent with 3 and then divide the result with 318.

E.g. at the example of ILS approach to Ramat David, we have at the 12 DME arc rate of descent

136 FT/NM. So this gives:

$(136 \times 3) / 318 = 1.28 \approx 1.3$ degrees, means that we must descent from IAF Fix at 10 DME to 10 DME via the 12 DME arc with 1.3 degrees.

Note that we have the same result with any pair, e.g. 5 deg. - 530 FT/NM gives also 1.3 degrees: $(136 \times 5) / 530 = 1.28 \approx 1.3$ degrees.

Keep in mind that the rate of descent in FT/NM is independent of velocity of the aircraft, as also its conversion to degrees.

Also the descent from FAF Fix to runway threshold for non-precision approaches is given with the VDA (Vertical Descent Angle) and shown in the IAP charts in degrees just after its symbol (< or >). In the next example of TACAN approach to Nea Anchialos, we see VDA of 2.50 degrees.

5) Setting the QNH

Don't forget to set the QNH of the altitude instrument while you transit from transition altitude to lower altitude by asking ATC (keys "T" and "T" and "1"). Transition altitude is given by the IAP charts in the profile at the lower left corner.

6) ILS limits

ILS Localizer provides course indications to 10 degrees either side of the course along a radius of 18 NM from the antenna and from 10 to 35 degrees either side of the course along a radius of 10 NM.

ILS Glide slope transmits a glide path beam 1.4 degrees wide. It is normally usable to the distance of 10 NM. In Falcon BMS 4.32 Glide slope's beam is 1.57 degrees wide (+0.085 degrees and -0.085 degrees). Obviously Glide slope's zone of receiving signal is very narrow and a lot of Falcon pilots think very often that the ILS Glide slope is not transmitting and it's an issue of the simulator, but actually they aren't in the proper altitude at the specific DME from runway.

In order to understand this better, let's see the example of ILS approach to Hatzor:

You see that at 6 DME from TACAN station (and at $0.9 + 3.9 = 4.8$ NM from runway threshold) must be at 1,780 FT. At the distance of 4.8 NM from runway threshold the Glide slope's beam has limits ± 400 FT, means from $1,780 - 400 = 1,380$ FT up to $1,780 + 400 = 2,180$ FT. In other words when you are exactly at 6 DME and on Localizer course, you will not have signal from Glide slope if you are below of 1,380 FT or if you are higher of 2,180 FT and the Glide slope bar inside HUD will be dashed and not moving. So pay special attention to altitude that intercepts the glidepath.
